

Unclassified environment for Azure Secret migration and low to high development

Sequoia Combine provides an unclassified Azure environment that accurately emulates the unique differences and constraints of the Azure Secret classified cloud region. Combine is continuously updated and supported by experienced cleared professionals in close partnership with Microsoft.

The Combine platform can be used to test and validate software solutions that are destined to be deployed to Azure Secret. Combine verifies that software solutions will function correctly in Azure Secret, and when it detects incompatibilities it proactively reports them to a centralized dashboard, dramatically accelerating migration.

The Combine platform can also be used to perform low to high development, leveraging more affordable resources in the unclassified space to build solutions that are delivered and deployed to the classified customer networks. Combine ensures that what is built on the low side will be compatible on the high side.

Core Features

Frequently updated emulation of service parity differences ensuring your workload only uses Azure services that are in the Azure Secret region

Configurable emulation of air-gapped network to detect any incompatibilities with external dependencies

Seamless emulation of Azure Secret service endpoints and their unique security configurations

Proactive reporting of all potential migration issues on a centralized dashboard to accelerate and simplify the migration process

Key Advantages

Gives confidence that software solutions built and designed in Azure commercial will migrate to Azure Secret successfully

Provides time and cost savings compared to migrating solutions directly in the classified cloud space

A proven solution tested by dozens of successful migrations and years of experience.

Benefits from the support and training provided by Sequoia's cleared professionals who both support classified cloud work on a daily
